

Greater Bayelsa Platform — Phase One Build Specification

1. Positioning & Brand Direction (applies to all copy, UI language, and content)

Greater Bayelsa is to be positioned as a **leadership development and civic capacity institution** — not a grassroots mobilization group, community union, or political organization. This affects every screen, label, and piece of copy in the platform.

Guiding rules for all builders/designers:

1. **Category language:** Use institutional, governance-oriented language throughout (e.g. "civic training," "leadership development," "leadership pipeline") — avoid political/mobilization/welfare terms ("mobilization," "campaign," "welfare," "benefits").
 2. **Structure is a visible feature, not a hidden admin detail:** The organizational chart, directorates, and the leadership vetting/induction process should be shown publicly as proof of legitimacy and standards — not buried in internal docs.
 3. **Leader profiles show credentials, not just titles:** training completed, tenure, vetting status — reinforcing that leadership is earned, not appointed or paid staff.
 4. **Reframe member benefits as development, not welfare:** insurance, loans, job/scholarship access should sit under a "Member Development" / "Growth Opportunities" heading, not "Benefits" or "Welfare."
 5. **The six-village phase-one rollout is a pilot/proof-of-institution model,** not just an internal ops rollout — structure reporting/outcomes data so it can later be shown externally as a model.
-

2. Core Data Model

- **User:** every person on the platform; has a `role` (member / unit_leader / village_head / assistant / founder); profile fields per Section 6 below.
- **Geography hierarchy:** `Zone` → `District` → `Village` → `Unit` . Phase one only

populates and uses `Village` and `Unit` , but `Zone` and `District` must exist in the schema now so statewide expansion later doesn't require restructuring.

- **Membership:** links a `User` to a `Unit` ; carries membership ID (unique lookup code), status (active/inactive), category (full-time/part-time), join date.
- **Leadership:** a role-assignment layer — records that User X is leader of Unit/Village Y, with a start date and optional end date (supports tenure/rotation).

Phase-one role hierarchy & visibility

```
Founder (full visibility, all 6 villages)
  → Assistant (near-full visibility, day-to-day ops focus)
    → Village Head (own village, all units within it)
      → Unit Leader (own unit only)
        → Member (own profile only)
```

Note: monthly meetings happen **at village level** (all units in a village gather as one meeting) — units are an organizational/reporting layer, not a separate meeting body.

3. Dashboards by Role

- **Founder:** full overview across all six villages — aggregate membership numbers, activity across every unit/village, drill-down into any village or unit, master calendar, dues status roll-up, community-updates feed (all villages, urgent items surfaced first).
- **Assistant:** same near-full visibility as Founder, but oriented around daily operations — pending approvals, follow-ups, and action items surfaced first rather than a strategic overview.
- **Village Head:** own village broken down by units — each unit leader, unit member counts/activity, village-level dues status, meeting-update submission tool (see Section 5), local calendar events.
- **Unit Leader:** own unit's member list (add/update members), unit-level dues tracking incl. bulk payment recording, own dashboard/login (not just a title).
- **Member:** own profile, membership status, dues/benefits ("Member Development") info, notifications, activity calendar (own unit/village + org-wide fixed dates), direct feedback/reporting tool (Section 7).

Calendar (appears on every role's dashboard, scoped by role per above)

Two layers:

1. **Org-wide fixed dates** — set by headquarters only, not locally editable (e.g. shared monthly meeting date, anniversary, major org-wide events). Same date across all six villages.
 2. **Local events** — added by village heads/unit leaders (village-specific gatherings, trainings, etc.); visible only on that village/unit's calendar, but roll up visibly to headquarters.
-

4. Dues & Payments

- Dues are symbolic/small (e.g. ₦100/month) — the purpose is establishing the formal cooperative-membership relationship (Greater Bayelsa is a registered cooperative society), not funding the org. Member benefits are intended to far outweigh dues paid.
 - **Hybrid collection model:**
 - Digital: member pays in-platform via a payment gateway (Paystack/Flutterwave-style integration).
 - Cash: member pays cash to their unit leader, who then does a **single bulk payment** on behalf of all their unit's members via a POS agent.
 - **Bulk payment recording tool** (unit leader): select multiple members → mark paid for the period → attach POS transaction reference/receipt. The bulk payment record is logged against the submitting unit leader for accountability (individual-level audit isn't required given the small amounts — the key output is current/overdue status per member).
 - **Reporting roll-up:** unit leader sees own unit's paid/overdue members → village head sees aggregated status across their units → founder/assistant see status across all six villages.
 - **Automated dues reminders:** in-platform notification + echoed via WhatsApp/Telegram.
-

5. Monthly Meeting Update (submitted by Village Head,

after each village-level meeting)

Required fields:

- Date meeting was held
- Attendance count (with optional breakdown by unit)
- Key discussion points / decisions made
- **Requests to headquarters** — a distinct field/mini-workflow (not buried in notes) so HQ can view, respond to, and mark resolved
- **Evidentiary media (mandatory)**: minimum 5 photos + 1 video (minimum 2 minutes length) — required, not optional, as proof the meeting took place. Stored as part of the permanent meeting record for HQ spot-checking.

Attendance verification (hybrid, both methods member-verified, not leader-asserted)

1. **Primary — QR code self-check-in**: village head displays a QR code at the meeting; members with smartphones scan it to log their own attendance.
2. **Fallback — short video verification** (for members without smartphones): the leader activates a short video recording; the member states their name and says “present” on camera; the clip is uploaded and attached as that specific member’s individual attendance proof.

Both methods feed into one unified attendance record, tagged by verification method (QR vs. video).

6. Membership Enrollment Form

Fields to capture:

- VIN / voter’s card number (mandatory — cross-checked against imported voter database)
- Full name (matched against voter record)
- Phone number
- Profile photo (mandatory)
- Date of birth (confirms 18+ eligibility)

- Occupation
- Address
- Marital status
- Village + Unit assignment (village typically locked to the enrolling coordinator's village; unit selected)
- Membership category (full-time / part-time)
- Password (set at enrollment)
- Email (optional)
- WhatsApp number (for group/channel add at enrollment)
- Emergency contact / next-of-kin
- **CV upload** — if member has no CV, the enrolling coordinator writes a short bio/description instead

Purpose: beyond identity, this builds a scannable skills/talent pool so the org can match members to trainings or job/opportunity referrals as they arise.

Enrollment is performed by the village coordinator only — there is no self-serve enrollment step; the coordinator enters the data after the AI screening (Section 8) and their own in-person/WhatsApp vetting.

7. Direct Member-to-Headquarters Feedback Channel

- A reporting tool on the member dashboard that bypasses the local leadership chain (unit leader/village head) entirely — for issues like leader misconduct, unreported security problems, or dues disputes.
- **Structured dropdown categories** (not free-form text) — e.g. Leadership Concern, Security Issue, Dues Dispute — for HQ triage.
- **Not anonymous** — headquarters must always be able to see which member submitted a given report.

8. Public-Facing Front End (pre-login)

No general public self-registration exists anywhere on this site — membership must stay

verifiably local/grassroots.

Pages/sections:

- **Homepage:** leads with institutional positioning (leadership development/civic capacity framing).
 - **Org structure section:** directorates, leadership pipeline — shown as a legitimacy/transparency feature.
 - **About/Vision:** mission, founding story.
 - **Leadership/Team page:** leader profiles with bios, credentials, photos.
 - **News/Blog:** updates, achievements, impact stories.
 - **Impact/Programs section:** training and development opportunities, framed as growth (not “welfare”/“benefits”).
 - **Membership/Eligibility explainer.**
 - **Register Now page:**
 - Explanatory copy: Greater Bayelsa is currently piloting in this constituency (Sagbama Constituency One) and will gradually expand statewide.
 - List of the six villages, each showing its coordinator’s short bio + profile photo, with a “Contact Coordinator” button.
 - Clicking “Contact Coordinator” does **not** go straight to a human WhatsApp chat. It opens an **AI screening chat** first (see Section 9).
-

9. AI Screening Chat (pre-enrollment eligibility check)

- Welcomes the visitor and asks vetting questions (e.g. “Are you originally from this place?” / “Which village or unit do you belong to?”).
- **Verifies against real data**, not self-report only: backend holds the official constituency voter database (imported from INEC), with each voter’s unit/village pre-mapped.
- Visitor provides name (and ideally VIN/voter number, to disambiguate name clashes) → system looks them up and responds definitively:
 - Confirmed eligible → tells them their unit, and hands off / links them to their village coordinator’s WhatsApp to continue.

- Not found on the constituency voter roll → tells them clearly they are not eligible; **does not** hand off to a coordinator.
 - The AI only verifies eligibility. It does **not** enroll the member — actual enrollment (Section 6) is performed by the human coordinator after handoff.
-

10. Admin Capabilities (Founder / Assistant level)

- Import/view voter data (INEC database) for AI screening and enrollment cross-checks.
 - Role management by village/unit.
 - Create additional admin accounts.
 - Bulk or individual messaging to registered members (dashboard and/or email).
 - Full member listing, filterable by village/unit/status.
 - Community-updates feed across all villages, sorted with urgent (e.g. security) items surfaced first.
 - Master calendar across all six villages.
-

11. Integrations Needed

- Payment gateway (Paystack/Flutterwave-style) for in-platform dues payments.
- WhatsApp deep-linking (coordinator contact buttons, AI-to-coordinator handoff, reminder echoes).
- Telegram group-join integration.
- Voter database import/lookup (INEC data for the constituency).
- Media upload/storage for meeting evidence (photos + video) and video-based attendance verification.
